

*UNITED STATES*  
**DEPARTMENT OF TRANSPORTATION**

*ITS ePrimer*  
**Module 8: Electronic Toll Collection,  
Electronic Payment Systems, and Pricing**

March 2016

**ITS Professional Capacity Building  
Program**

**ITS Joint Program Office  
U.S. Department of Transportation**

# Instructor

---

**Bob McQueen, CEng, MICE**

CEO

Bob McQueen and Associates Inc.  
Orlando, FL, USA

# Learning Objectives

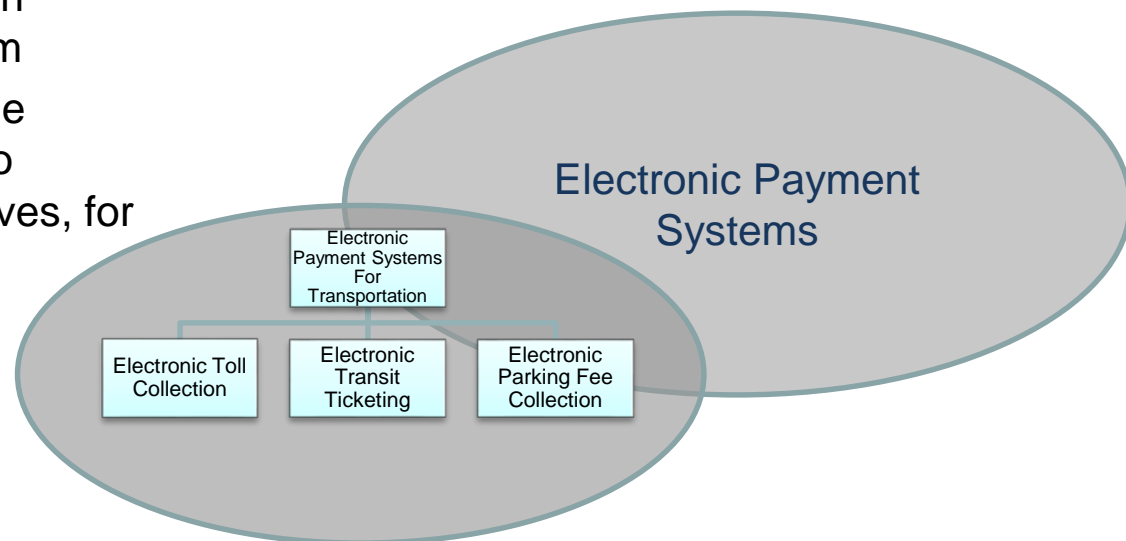

---

- Understand the basic terminology of electronic payment systems applications and pricing strategies
- Describe electronic payment technologies, applications, and strategies
- Understand the application of electronic payment systems applications to transportation and Intelligent Transportation Systems and describe some challenges
- Understand the approximate costs and benefits associated with electronic payment systems applications and pricing
- Define the role of the private sector in electronic payment systems applications
- Describe some implementation examples and lessons learned

# Electronic Payment Systems Introduction

- **Technologies** – the technologies and products that can be applied to our needs, issues, problems and objectives. For example, contactless payment technologies
- **Applications** – specific technology implementations designed to address a set of needs, for example, an electronic toll collection system
- **Strategies** – ways in which the technologies can be applied to achieve specific policy objectives, for example, congestion pricing

# SFPark San Francisco

---

- The following link points to a video that provides an example of a smart car parking system being implemented in San Francisco
- This shows how electronic payment systems can be applied to fee collection for parking within a wider congestion management context

<http://sfpark.org/resources/sfpark-overview-video/>

# Non-cash Transactions Worldwide

---

- 260 billion on-cash transactions worldwide
- Electronic payment techniques are growing in importance every year
- The USA accounts for more than 40% of the total, with 104 billion transactions
- Transportation electronic payment systems fit within this larger context and benefit from innovation and development from the wider market

# Contactless Payment Systems

- Short-range wireless technologies are used to enable payment without contact between the payment device and the reader
- This example shows a contactless smart card being used to pay for a transit fare in Finland

Contactless Smartcard use for Transit in Finland. Retrieved from: [http://en.wikipedia.org/wiki/File:Matkakortti\\_ja\\_kortinlukija.jpg](http://en.wikipedia.org/wiki/File:Matkakortti_ja_kortinlukija.jpg) on January 31 2013

# Near Field Communications

- The use of cell phones and smart phones to support contactless payment is known as Near Field Communications (NFC)
- This differentiates between this use and the use of the phone as a wide area wireless device for voice and data communications
- It also covers communications between one phone and another one
- Applications include Android Pay and Apple Pay

Use of NFC for Transit Ticketing in Austria. Retrieved from: <http://en.wikipedia.org/wiki/File:NFCFahrscheinentwerter.jpg>, on January 31, 2013

# Android Pay and Apple Pay

---

- Use Near Field Communications technology
- Enables you to use your credit cards, store credit cards, and rewards cards with your smartphone or smart watch
- Apple Pay works with the cards you already have on the devices you use every day.
- Card details are never shared and aren't stored on your device at all
- Both let you use smartphones or smart watches to pay in over a million stores accepting contactless payments. You can also make purchases within participating apps.

Apple Pay being used to purchase a cup of coffee retrieved from Wikipedia on April 18 2016

<https://commons.wikimedia.org/wiki/File:Apple-payment-square.jpg>

# Android Pay and Apple Pay Operation

---

- Android Pay was introduced in 2015 and Apple Pay was introduced in 2014  
Both make use of Near Field Communications combined with Host Card Emulation (HCE)
- As the name suggests Host Card Emulation enables a smart phone to emulate a credit card and communicate with an appropriate Near Field Communication reader
- The user enters credit card data into the smart phone where is stored securely. When the user pays for an item, the credit card data is encrypted or “tokenized”
- This generates a one-time use temporary credit card number that is used to pay, thus protecting the users real credit card number.
- The Android Pay approach makes use of a cloud-based store to retain these tokens, with a few tokens held securely on the smart phone to enable payment when there is no cell phone signal. The Apple Pay approach makes use of a special chip on board the phone to store the tokens.
- Similar electronic payment approaches are being introduced by a number of banks and also by Samsung, one of the major cell phone manufacturers.

# Smart Phones and Bar Codes

---

- Several major airlines are now using two-dimensional bar codes as a boarding pass
- You can download the bar code from the airline Web site and have it scanned by a special optical reader at TSA airport security
- The bar code is used as proof of payment

Samsung Focus Smartphone, retrieved from [http://upload.wikimedia.org/wikipedia/commons/5/5f/Mobile\\_boarding\\_pass\\_KLM.JPG](http://upload.wikimedia.org/wikipedia/commons/5/5f/Mobile_boarding_pass_KLM.JPG) on January 31, 2013

# Bar Code Billboards

- Large bar codes can be used to transmit a lot of information to passersby
- Scan the bar code with your smart phone loaded with a special app and you can be taken to an appropriate Web site for more information

Japan QR Code Billboard, retrieved from [http://en.wikipedia.org/wiki/File:Mobile\\_boarding\\_pass\\_KLM.JPG](http://en.wikipedia.org/wiki/File:Mobile_boarding_pass_KLM.JPG)

# Electronic Toll Collection

- Vehicle enters the toll zone and breaks the first laser beam (1), triggers transceiver (2)
- Transceiver signals vehicle's transponder/tag requesting time, date, and transponder, or tag identity
- Camera (3) photographs the vehicle's front license plate
- Vehicle breaks second laser beam (4) triggering the second camera (5)
- Second camera photographs the rear license plate

ETC concept from Stockholm Congestion Charging project.

[http://transportationfortomorrow.com/pdfs/commission\\_meetings/1006\\_meeting\\_washington/lamba\\_presentation\\_1006\\_meeting.pdf](http://transportationfortomorrow.com/pdfs/commission_meetings/1006_meeting_washington/lamba_presentation_1006_meeting.pdf) on June 5, 2013.

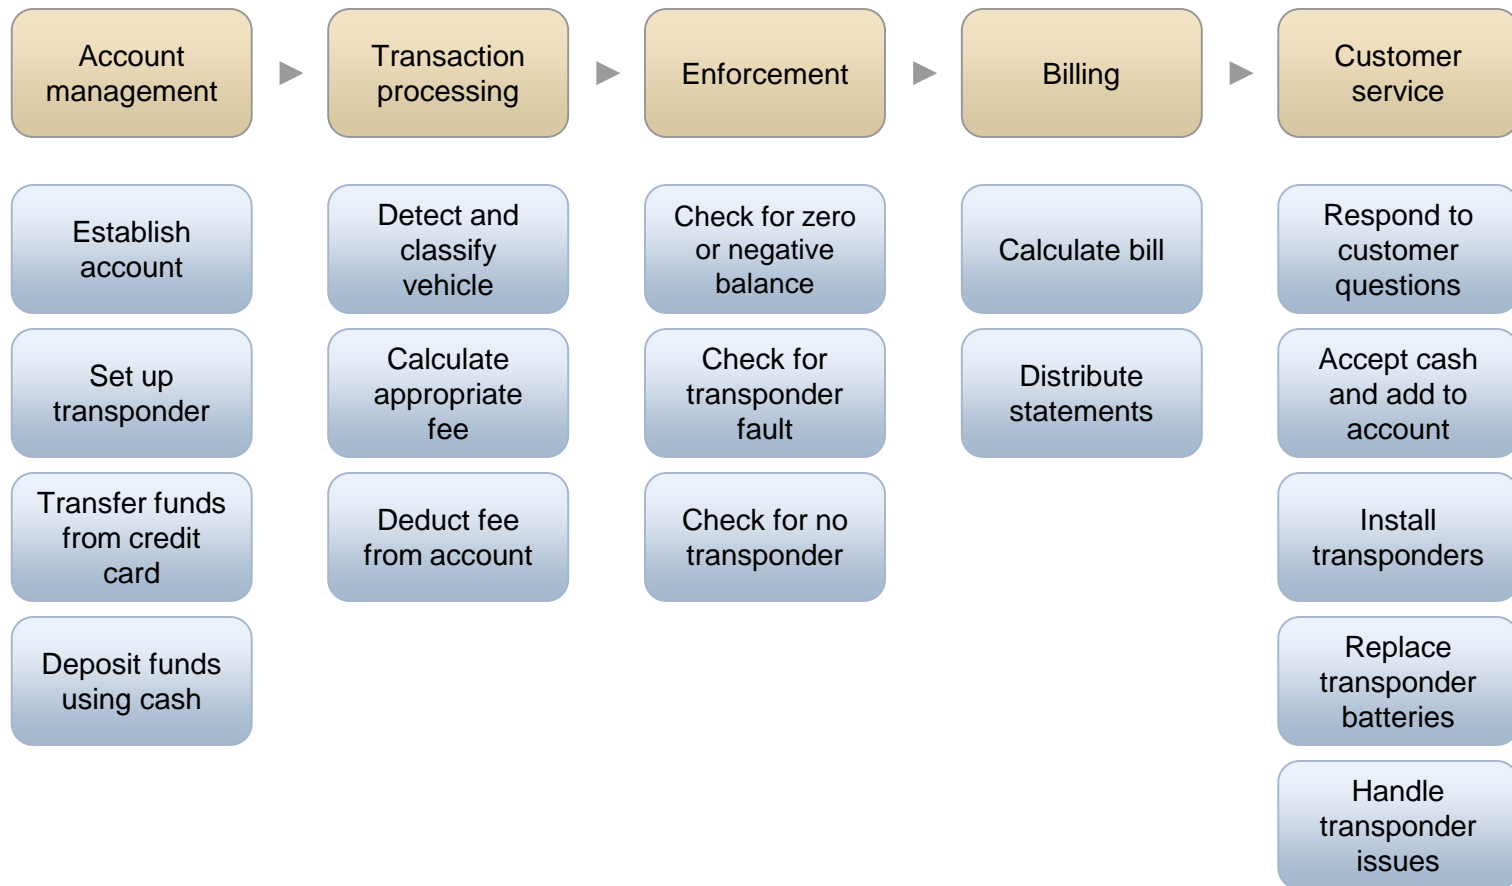

# Audience Interaction

---

- What is your opinion regarding open road tolling compared to all electronic toll collection?
  - Should drivers be forced to use electronic means only, or should we always leave the opportunity to pay for cash at the roadside?
  - Do the customer service benefits of accepting cash out weigh the cost of the cash collection?

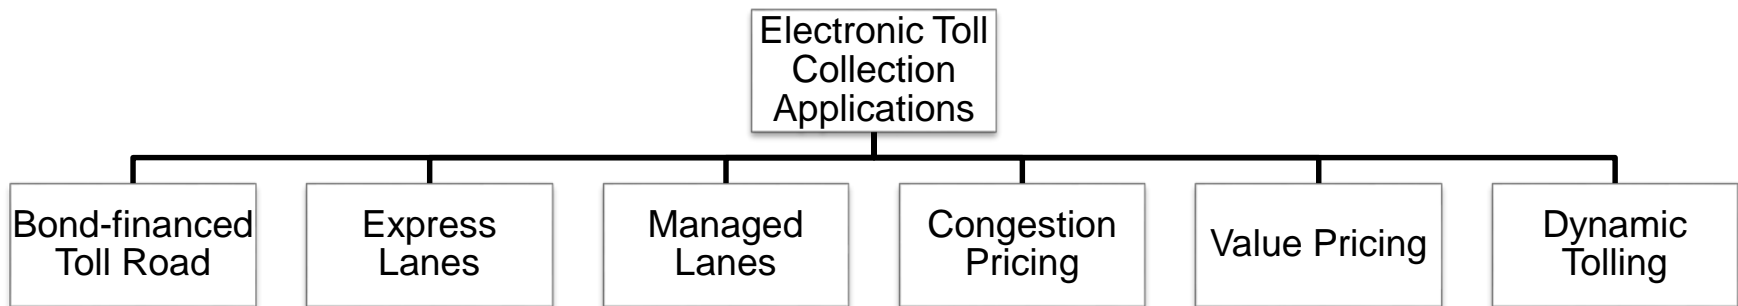

# Electronic Toll Process

# Pricing Strategies

---

- Now that we have electronic toll collection technologies at our disposal, there are a number of smart strategies that can be applied
- In ITS generally, there seems to be a change in emphasis from installing devices to discovering what management solutions we can apply

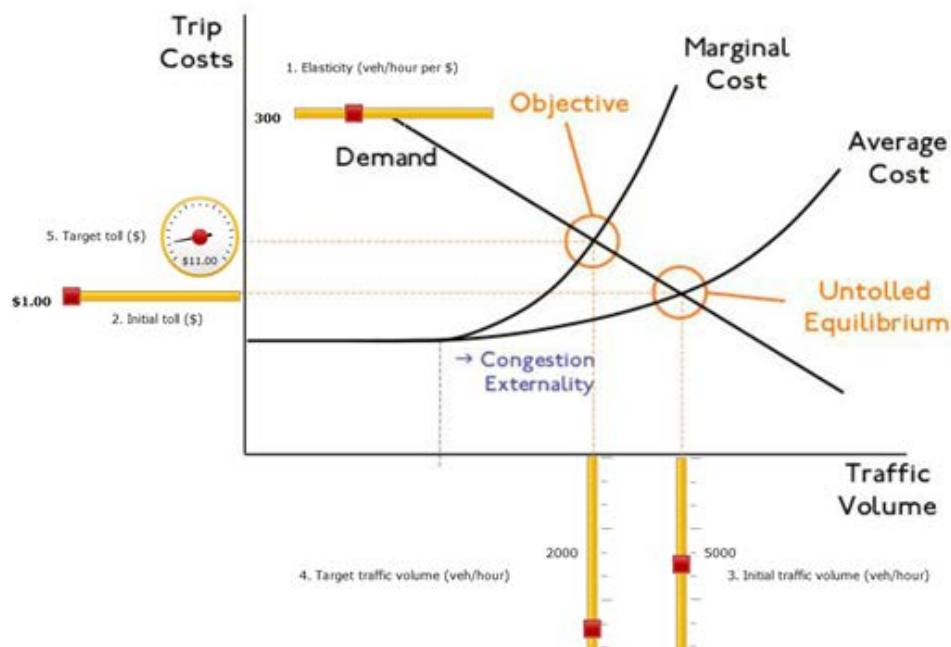

# Basic Economic Principles of Pricing

TE-Pricing-Equilibrium Congestion, retrieved from <http://en.wikipedia.org/wiki/File:TE-Pricing-EquilibriumCongestion.png> on May 21, 2013

# Pricing Economics Simulator (1/3)

Parameter	1	2	3	4	5
Scenario Description	elasticity (veh/hour/\$)	initial toll (\$)	initial traffic volume (veh/hour)	target traffic volume (veh/hour)	target toll (\$)
1 base case	300	1	5000	2000	\$11.00
2 change in elasticity	601	1	5000	2000	\$5.99
3 change in target traffic	300	1	5000	3801	\$3.00

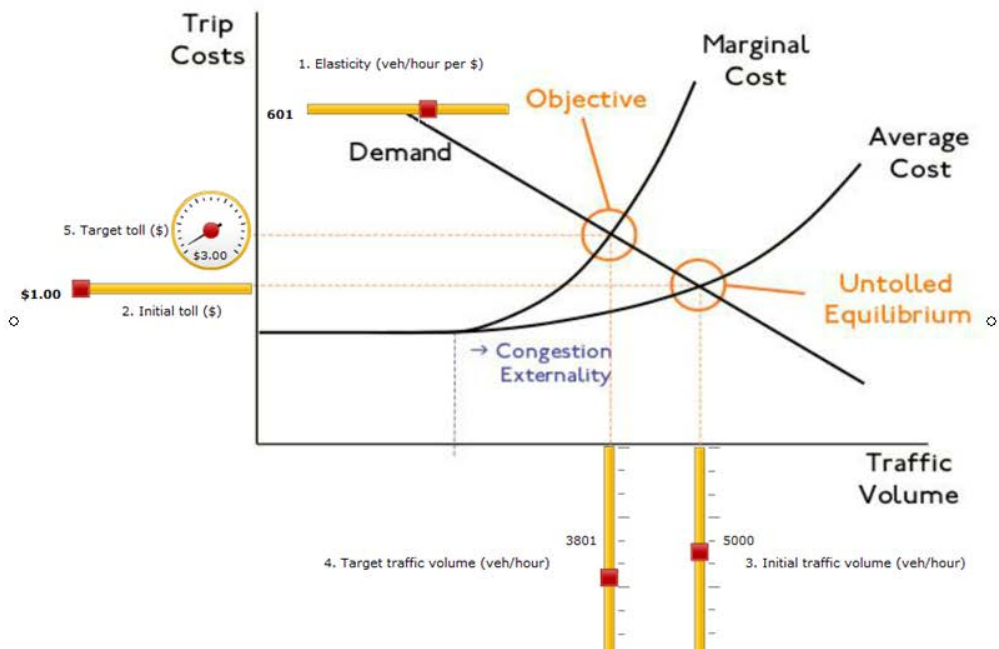

# Pricing Economics Simulator (2/3)

Parameter	1	2	3	4	5
Scenario Description	elasticity (veh/hour/\$)	initial toll (\$)	initial traffic volume (veh/hour)	target traffic volume (veh/hour)	target toll (\$)
1 base case	300	1	5000	2000	\$11.00
2 change in elasticity	601	1	5000	2000	\$5.99
3 traffic	300	1	5000	3801	\$3.00

# Pricing Economics Simulator (3/3)

Parameter	1	2	3	4	5
Scenario Description	elasticity (veh/hour/\$)	initial toll (\$)	initial traffic volume (veh/hour)	target traffic volume (veh/hour)	target toll (\$)
1 base case	300	1	5000	2000	\$11.00
2 change in elasticity	601	1	5000	2000	\$5.99
3 change in target traffic	601	1	5000	3801	\$3.00

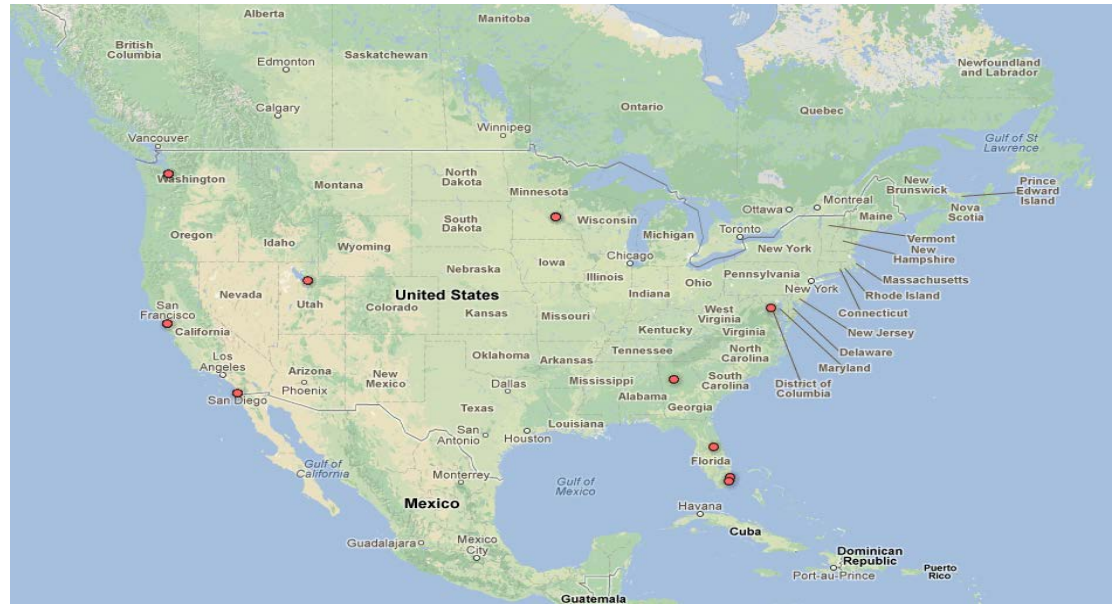

# Worldwide Pricing Projects

- There are almost 50 projects worldwide involving some form of pricing strategy.
- These projects represent a combination of toll roads, urban congestion pricing, value pricing, managed lanes, and express lanes strategy implementations.

# Dynamic Tolling Projects in the USA

- There are 11 projects that are conducting dynamic tolling currently in the U.S.
- Dynamic tolling can be viewed as a subset of managed lanes or express lanes as they are operated under variable tolling regimes in order to achieve a specific traffic conditions objectives.

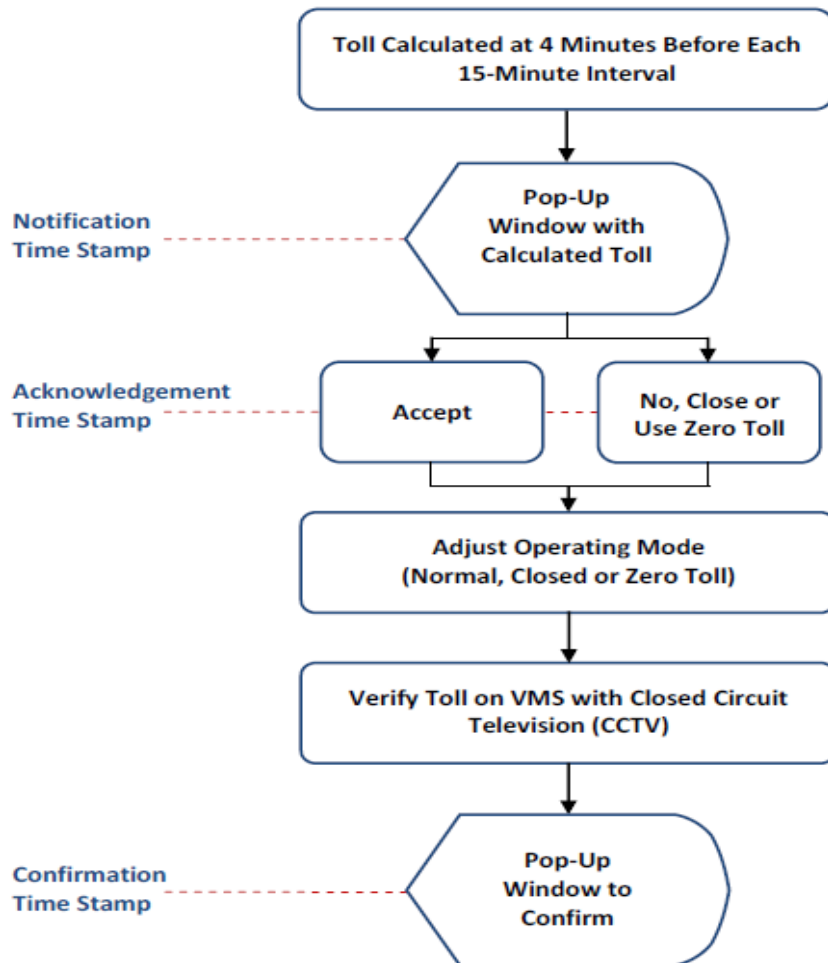

# Is It Variable or Dynamic Tolling?

---

Variable tolling	Pre-published schedules
	For each segment
	Vehicle classification
	Time of day
	Day of week
Dynamic tolling	For each segment
	Level of service based
	Value of time saved based
	Combination of level of service and value of time

# Typical Dynamic Tolling Algorithm

Source: *95 Express Toll Facilities Operations Manual*, Florida Department of Transportation, Version 2.0, December 2008.

# Audience Interaction

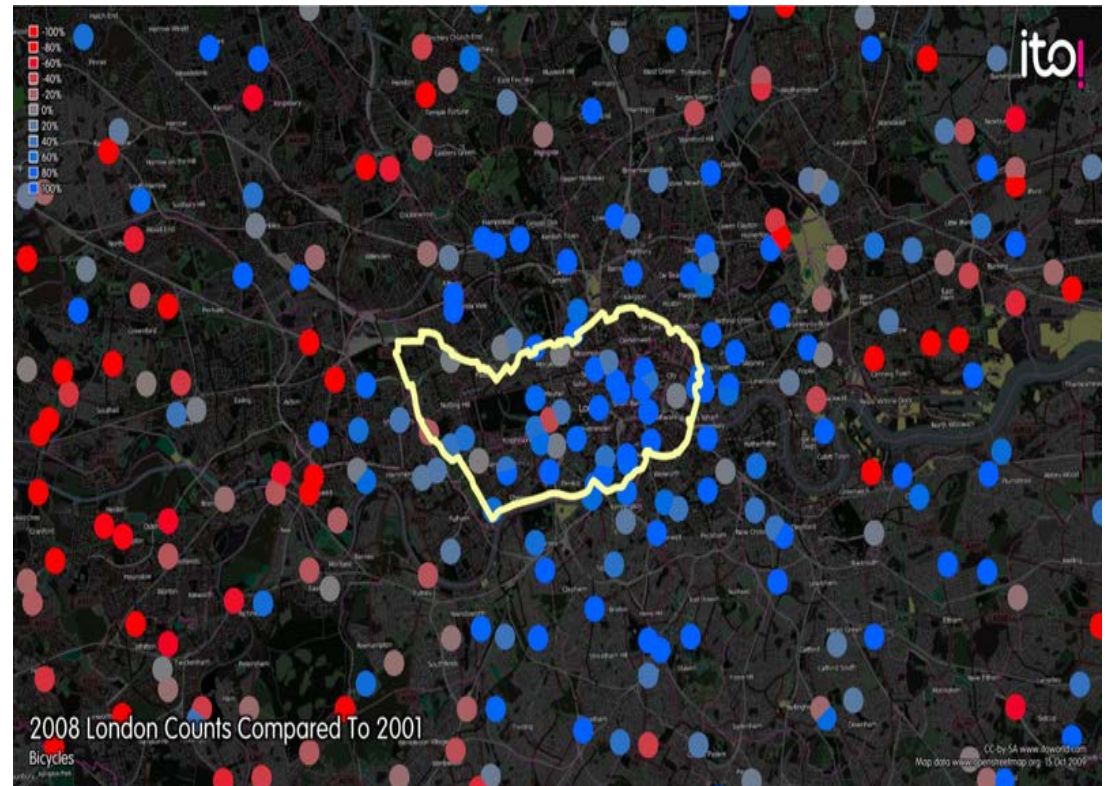

---

- What is your opinion regarding urban congestion pricing?
  - Would you be prepared to pay a mandatory fee for access to a downtown area in the U.S.?
  - Do you think that pricing is fair?

# Defining Strategic Objectives

- Congestion Reduction
- Peak Spreading
- Modal Shift
- Revenue Generation

Changes in the counts of bicycles in London at October 2008 compared to October 2001. Retrieved from [http://en.wikipedia.org/wiki/File:London\\_congestion\\_cycles.png](http://en.wikipedia.org/wiki/File:London_congestion_cycles.png) on January, 31 2013

# Multimodal Electronic Payment Systems

---

- Regional multimodal electronic payment system - all modes of transportation addressed by single payment system
- While there may be one single payment system there may be different payment devices
  - For example, vehicle-based payment can be achieved by transponder or tag while personal based payments such as ticketing for transit systems can be accomplished with a smartcard
  - The same account can be used for both even if different payment devices are used
- Regional multimodal approach offers more management solution possibilities
  - For example, conditional discounts could be offered where users of the transit system on one particular day may be offered free parking downtown for another day when they decide to take their car

# Challenges

---

- Requirements definition
- Proprietary technologies
- Funding and financing
- Future proofing
- Privacy and anonymity
- Fairness and equity
- Fitting within the wider context
- Harnessing regional partners
- Finding the best business model

# Electronic Payment, Transportation, ITS

---

- Electronic toll collection and pricing considered as a subset of ITS
- Many ITS applications complementary to electronic toll collection and pricing systems
- Electronic toll collection and pricing set within a wider context of performance management
- Electronic payment systems applications can be powerful collectors of data for performance management
- Electronic payment systems applications fit within ITS and transportation management through delivery of more efficient data collection and demand management
- The flexibility of electronic systems to adjust payment provides demand management possibilities

# The Role of the Private Sector

---

- Providing technology products and services
  - The private sector may have already invested considerable sums in technologies, products and services that can be incorporated into a public agency project
- Providing expertise and experience
  - Many private sector companies have the ability to conduct business worldwide and may have gathered expertise and experience that is difficult to accumulate in a local context
- Providing financing
  - It may also be possible for the private sector to provide financing under a suitable public private partnership relationship
- Defining a business model helps to define the private sector role in the implementation

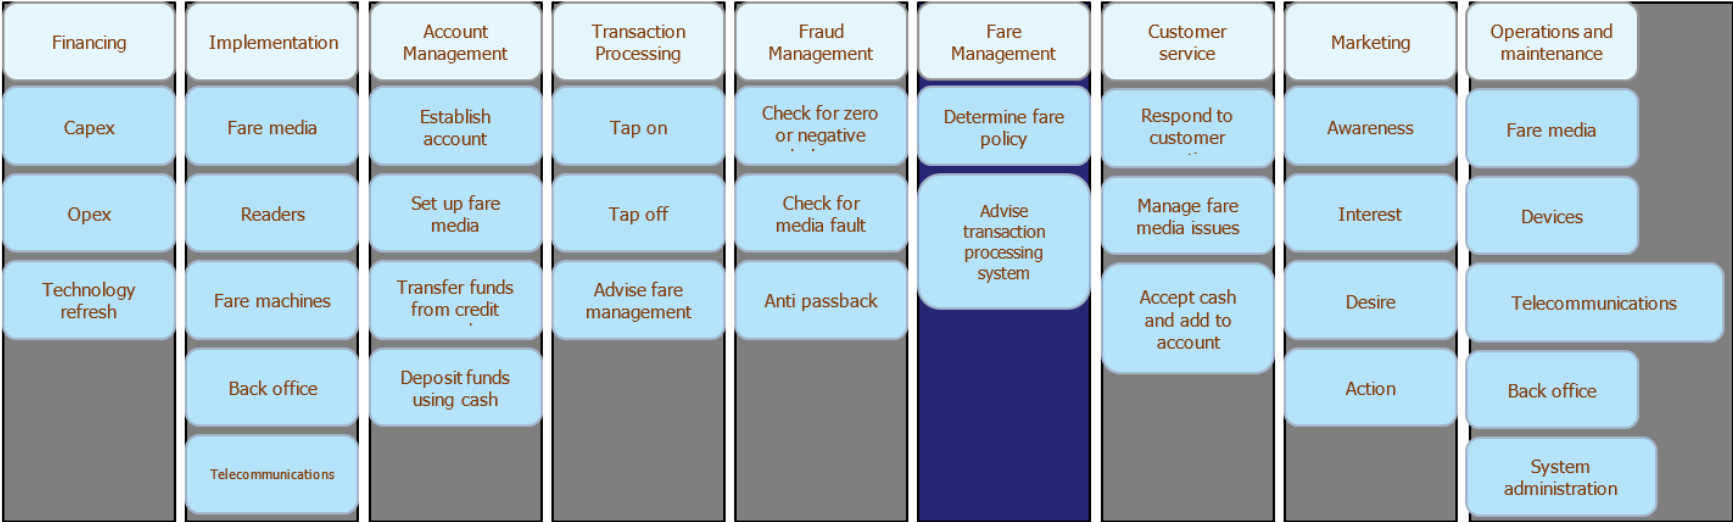

# Business Models

---

- More than technology, business models and business processes are very important
- There are also new choices to acquire a service rather than technologies
- The next few slides illustrate this with business process models from two transit agencies that acquired electronic ticketing capabilities recently
  - Chicago Transit Authority (CTA), Chicago
  - Dallas Area Rapid Transit (DART), Dallas

# CTA Chicago Business Model

CTA

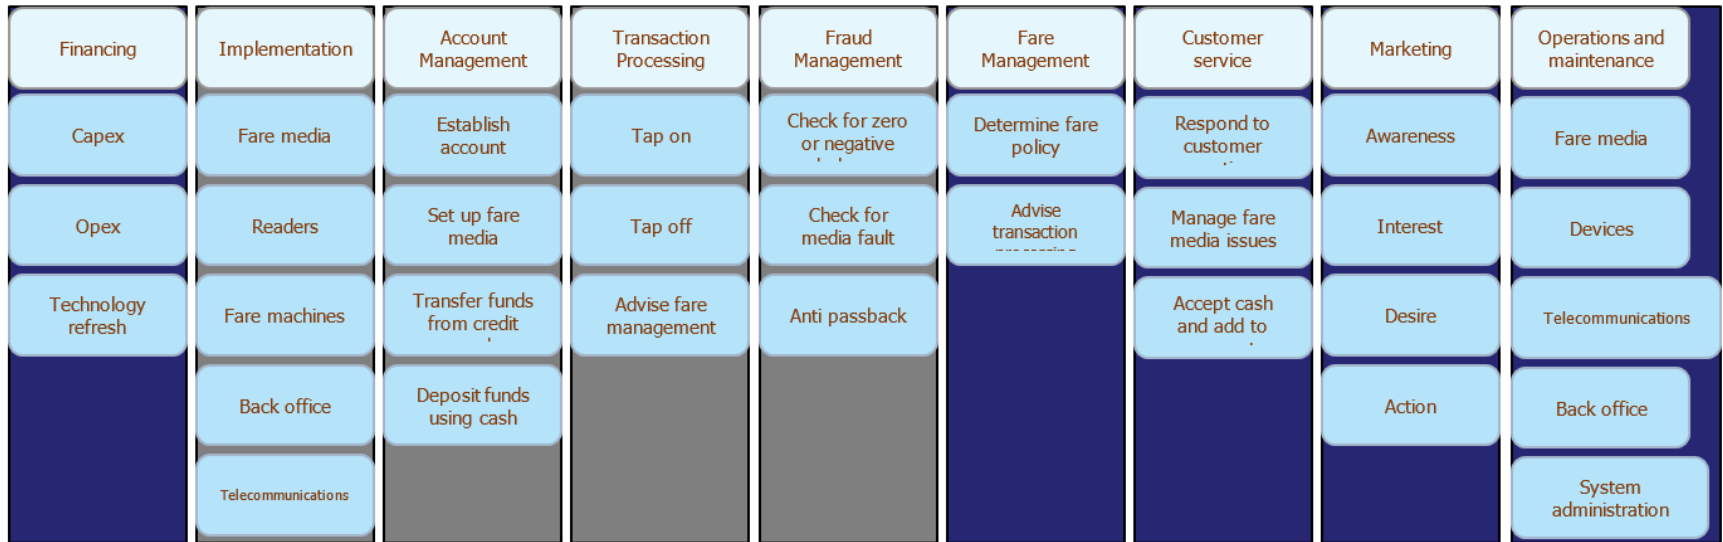

Service Provider

# DART Dallas Business Model

DART

Service Provider

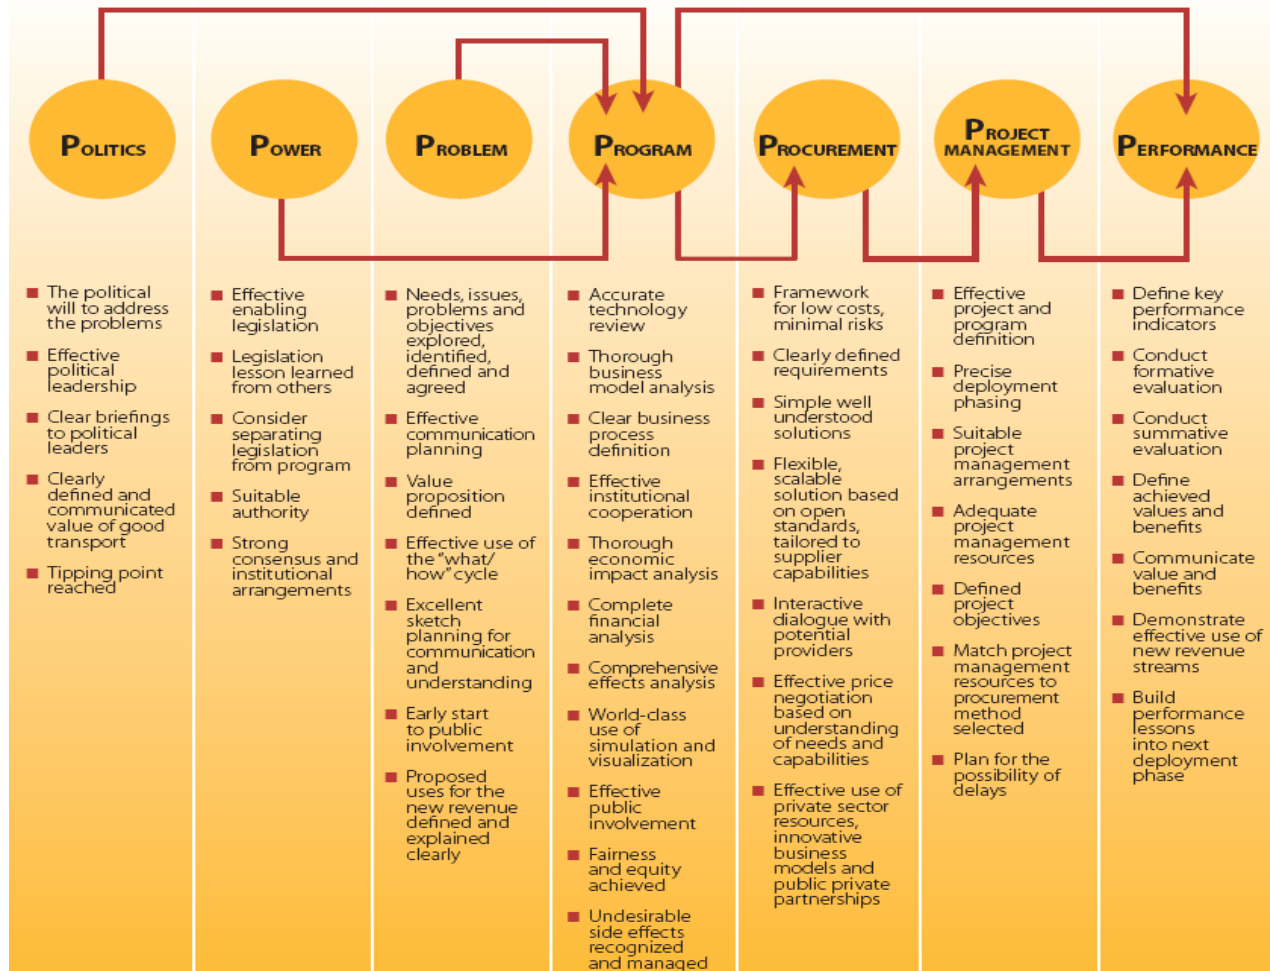

# Illustrative Examples

Name of Project	Description	Web Link
1 ORCA Card	Implemented a single smart card for bus, rail, and ferry services in the Seattle Metro area. Single card, multiple modes, multiple service providers	<a href="http://www.orcacard.com">www.orcacard.com</a>
2 New Jersey Transit Google Wallet trial	Trial of smartphone technology to pay for transit fares in New Jersey with Google Wallet	<a href="http://www.reuters.com/article/2010/09/21/usvisamobileidUSTRE68K2DG20100921">http://www.reuters.com/article/2010/09/21/usvisamobileidUSTRE68K2DG20100921</a> on February 2 2013
3 New York and New Jersey NFC payment trial	Trial involving MasterCard and Visa on the use of smartphones with NFC technology for transit fare payment	<a href="http://www.reuters.com/article/2010/09/21/usvisamobileidUSTRE68K2DG20100921">http://www.reuters.com/article/2010/09/21/usvisamobileidUSTRE68K2DG20100921</a>
4 Houston Katy Freeway Express Lanes	Dynamic tolling on express lanes retrofitted in the median of major freeway	<a href="https://www.hctra.org/katymanagedlanes/how_it_works.html">https://www.hctra.org/katymanagedlanes/how_it_works.html</a> on January 31 2013
5 WMATA Washington DC – SmarTrip	Smart card system for paying bus and Metro fares in Washington DC	<a href="http://www.wmata.com/fares/smartrip/">http://www.wmata.com/fares/smartrip/</a>
6 CTA Chicago Card	Smart card system for paying bus and Metro fares across multiple operators in the Chicago Metropolitan Area	<a href="http://www.chicagocard.com/ccplus/firsttime.aspx">http://www.chicagocard.com/ccplus/firsttime.aspx</a>
7 I15 FasTrak Tolls San Diego	First implementation of dynamic tolling on express lanes in the USA	<a href="http://www.sandag.org/uploads/publicationid/publicationid_6_1065.pdf">http://www.sandag.org/uploads/publicationid/publicationid_6_1065.pdf</a>
8 EZPass Group	Coalition of agencies in the northeast sharing interoperable electronic toll collection system and central clearing/settlement	<a href="http://www.ezpassiac.com/aboutus/overview">http://www.ezpassiac.com/aboutus/overview</a>
9 Oregon Mileage Based Road User Fees	Pilot projects and legislation development to replace fuel based taxation with distance based	<a href="http://www.oregon.gov/ODOT/HWY/RUFPP/pages/rucpp.aspx">http://www.oregon.gov/ODOT/HWY/RUFPP/pages/rucpp.aspx</a>

# Lessons Learned

# The Cost of Change Lesson

---

- The lesson is simple – ambiguity costs money.
- Ambiguity appears in system requirements due to lack of formal agreement on what the system is designed to do and lack of definition on specific requirements.
- As a rule of thumb it will cost approximately \$1,000 to correct problems during the deployment stage.
- While that same problem could have been dealt with during the requirements gathering stage for approximately \$1.
- That is why it's worthwhile investing heavily in initial requirements analysis and objectives agreement.

# Typical Cost Elements

Application	Payment Device	Point of Sale Device	Telecommunications	Back Office
Electronic Toll Collection	Transponder: \$20 Or Sticker tag: \$4 each	Toll zone readers, lane computer, enforcement system: \$1 million per zone for 3 lanes	Design and Install Fiber Optic Cable: \$40 per foot	Account management, transaction processing, enforcement, billing and customer service hardware, software: \$400,000
Electronic transit ticketing	Contactless Smart Card: \$5 each	Fare Box with Smart Card Reader: \$15,000	Wireless Communications between Vehicles and Back Office	Account management, transaction processing, enforcement, billing and customer service hardware, software: \$400,000
Electronic Fee Collection for Car Parking	Transponder: \$20 or Sticker tag: \$4 or smart card \$5 or smartphone \$0 each	Access control system: \$15,000 per lane, or Kiosk: \$15,000 or Smart Meter: \$10,000	Design and Install Fiber Optic Cable: \$40 per foot	Account management, transaction processing, enforcement, billing and customer service hardware, software: \$400,000

# Summary

---

- Electronic payment systems for transportation fit within a wider context of payment systems
- Electronic payment systems are comprised of technologies
- Electronic payment systems solutions are applied to a number of application areas.
  - Electronic toll collection
  - Electronic transit ticketing
  - Electronic fee collection for parking
  - Multimodal electronic payment systems
- Electronic toll collection can be carried out in a number of ways.
  - Open road tolling
  - All electronic toll collection
  - Dynamic tolling
- There are a number of pricing strategies that can be applied
  - Bond financed toll roads.
  - Express lanes.
  - Managed lanes
  - congestion pricing.
  - Value pricing
  - Dynamic tolling
- Pricing is based on a basic economic principles relating cost of travel to demand for travel
- There are multiple potential roles for the private sector in an electronic payment system
- Multiple lessons have been learned from prior implementations
- A significant body of knowledge has been developed for both benefits and costs
- Electronic payment systems have been proven to deliver value in terms of safety, efficiency, and customer service

# Questions

---

1. What is the difference between ORT and AETC?
2. Describe one electronic payment technology, one application, and one strategy.
3. What is the relationship between electronic payment systems and performance management?
4. Name two challenges that could be faced implementing electronic transportation payment systems.
5. Name one benefit of electronic payment systems applications and pricing.
6. Define one role that the private sector might play in electronic payment systems.
7. Describe two implementation examples and results achieved.
